The Animal Kingdom

For this assignment you will create a Python package called `Animals`. It will contain subpackages for `Mammals`, `Birds`, `Fish`, and `SquirmyThings`. Each subpackage contains a module that defines a class of the same name, and a module called `helpers.py` that defines some helper functions. See the sample files included in the zip file you downloaded. In addition, you must add `__init__.py` to each package.

When the package is complete, create a file called `animal_tester.py` that tests the package and its contents.
